

EXPERIMENT 9

Aim : To understand Docker Architecture and Container Life Cycle, install Docker and execute docker commands to manage images and interact with containers

Theory :

Docker is a containerization platform that enables developers to package applications and their dependencies into lightweight, portable units called containers. Unlike traditional virtual machines, containers share the host operating system kernel, making them more efficient in terms of resource utilization and faster to start. Docker follows a client-server architecture, where the Docker client communicates with the Docker daemon to build, run, and manage containers.

The Docker architecture consists of key components such as Docker Client, Docker Daemon, Docker Images, and Docker Containers. The client sends commands (e.g., build, run, pull) to the daemon, which performs operations like creating and managing containers. Docker images are read-only templates used to create containers, while containers are running instances of these images. Docker also uses registries like Docker Hub to store and distribute images.

The container life cycle in Docker includes multiple stages: Create, Start, Run, Pause/Unpause, Stop, and Remove. A container is created from an image, started to execute the application, and can be paused or stopped when not in use. It can also be restarted or removed when no longer needed. By executing Docker commands, users can manage images and interact with containers efficiently, enabling consistent development, testing, and deployment across different environments.

```
C:\Users\Lenovo>docker --help

Usage:  docker [OPTIONS] COMMAND

A self-sufficient runtime for containers

Common Commands:
run      Create and run a new container from an image
exec     Execute a command in a running container
ps       List containers
build    Build an image from a Dockerfile
pull     Download an image from a registry
push     Upload an image to a registry
images   List images
login    Log in to a registry
logout   Log out from a registry
search   Search Docker Hub for images
version  Show the Docker version information
info     Display system-wide information

Management Commands:
builder  Manage builds
buildx*  Docker Buildx (Docker Inc., v0.12.1-desktop.4)
compose* Docker Compose (Docker Inc., v2.24.6-desktop.1)
container Manage containers
context  Manage contexts
debug*   Get a shell into any image or container. (Docker Inc., 0.0.24)
dev*     Docker Dev Environments (Docker Inc., v0.1.0)
extension* Manage Docker extensions (Docker Inc., v0.2.22)
feedback* Provide feedback, right in your terminal! (Docker Inc., v1.0.4)
image    Manage images
init*    Creates Docker-related starter files for your project (Docker Inc., v1.0.1)
manifest Manage Docker image manifests and manifest lists
network  Manage networks
plugin   Manage plugins
sbom*    View the packaged-based Software Bill Of Materials (SBOM) for an image (Anchore Inc., 0.6.0)
scout*   Docker Scout (Docker Inc., v1.5.0)
system   Manage Docker
trust    Manage trust on Docker images
volume   Manage volumes
```

```
C:\Users\Lenovo>docker --version
Docker version 25.0.3, build 4debf41
```

```
C:\Users\Lenovo>
```

```
C:\Users\Lenovo>docker search ubuntu
```
